## **I. Introduction**

Consider the following quadratic random functional differential equation on unbounded intervals,

Consider the following quadratic random functional differential equation on unbounded intervals,

\n
$$
\left[\frac{p(t, \omega)u(t, \omega)}{f(t, u(t, \omega), \omega)}\right] = g(t, u(t, \omega), u_t, \omega) + h(t, u(t, \omega), u_t, \omega) + k(t, u(t, \omega), u_t, \omega), \ a.e. t \in R_+
$$
\n(1.1)

Where  $p \in CRB(R_+)$ ,  $f: R_+ \times R \rightarrow R \setminus \{0\}$ ,  $g: R_+ \times R \times C \rightarrow R$  and  $h: R_+ \times R \times C \rightarrow R$ .

 The problem(1.1)have been studied on closed and bounded intervals by many authors..The above problem (1.1 ) is not discussed on unbounded intervals .Here, we have discussed on unbounded intervals and prove the existence and attractivity results by application of hybrid fixed point theory.

#### **II. Auxiliary Results**

Let  $I_0 = [-\delta, 0]$  be a closed , bounded interval in real line R for some real number  $\delta > 0$  and let  $J = I_0 \cup R_+$ . We have use the following result for proving the main existence result.

**Theorem2.1 (Dhage[10]).** Let S be a non-empty, closed convex and bounded subset of the Banach algebra U **Theorem 2.1 (Diage [10]).** Let S be a non-empty, closed convex<br>and Let  $A:U \rightarrow U$  and  $B: S \rightarrow U$  be two operators such that

(i)  $A(\omega)$   $A\big(\omega\big)$  is D-Lipschitz with D-function  $\psi,$ 

(ii)  $B(\omega) \ B(\omega)$  is completely continuous,<br>  $u = Au Bv \Longrightarrow u \in S$  *for all*  $v \in S$ *, and* 

(iii) 
$$
u = Au B v \implies u \in S
$$
 for all  $v \in S$ , and

 $(iv)$  $M \psi(t) < r$ , where  $M = ||B(S)|| = \sup{||Bu|| : u \in S}$ 

Then the operator equation  $Au$   $Bu = u$  has a solution in S.

We have needed following definitions.

**Definition 2.1**. The solutions of the operator equation  $Qu(t) = u(t)$  are locally attractive if there exists a closed ball  $\overline{B}_r(u_0)$  in  $BC(I_0 \cup R_+, R)$  for some  $u_0 \in BC(I_0 \cup R_+, R)$  such that for arbitrary solutions  $u = u(t)$  *and*  $v = v(t)$  of equation  $Qu(t) = u(t)$  belonging to  $\overline{B}_r(u_0)$ .

In the case when the limit is uniform with respect to the set  $\overline{B}_r(u_0)$ , then say that solutions of equation  $Qu(t)=u(t)$  are uniformly locally attractive on  $I_0 \cup R_+$ .

**Definition 2.2**. A solution  $u = u(t)$  of equation  $Qu(t) = u(t)$  is said to be globally attractive if  $\lim_{t\to\infty} (u(t)-v(t))=0$  holds for each solution  $v=v(t)$  of  $Qu(t)=u(t)$  in  $BC(I_0\cup R_+,R)$ .

### **III. Main Result**

Consider the following.

(A<sub>1</sub>). There is a continuous function h: 
$$
R_+ \to R_+
$$
 such that  
for all  $u \in R$  and  $v \in C$ . Also, let  $\lim_{t \to \infty} |\overline{p}(t)| \int_0^t h(s)ds = 0$ 

 $(A_2)\phi(0) \ge 0$ .

( $A_3$ ). The function  $t \to f(t, 0, 0)$  is bounded on  $R_+$  with  $F_0 = \sup\{|f(t, 0, 0)| : t \in R_+\}.$  $(A_4)$ . The function  $f: R_+ \times R \to R$  is continuous and there exists a function  $\ell \in BC(R_+, R)$  and a real number  $K > 0$  such that

$$
K > 0 \text{ such that}
$$
\n
$$
| f(t, u) - f(t, v) | \ell(t) \frac{|u - v|}{K + |u - v|} \text{ for all } t \in R_+ \text{ and } u, v \in R \text{ also}
$$
\n
$$
\text{suppose } \sup_{t \ge 0} \ell(t) = L.
$$

$$
\lim_{(A_5)\, \longrightarrow\, \infty} \left[ |f(t,u)| - f(t,v) \right] = 0 \text{ for all } u \in R.
$$

 $(A_6) \cdot f(0, \phi(0)) = 1$ 

 $(A_7)$ . Suppose  $u \to \frac{u}{f(0,u)}$  $u \rightarrow \frac{u}{\sqrt{u}}$  $f(0, u)$  $\rightarrow \frac{u}{\sqrt{u}}$  is injective.

**Theorem 3.1.** Suppose that  $(A_1)$ ,  $(A_3)$ ,  $(A_4)$ ,  $(A_6)$  and  $(A_7)$ ) holds. Further, assume that  $L \max{\{\|\phi\|, |\phi(0)| \|\bar{a}\| + W\}} \leq K.$ (3.1)

Then problem (1.1) admits a solution and solution is uniformly globally attractive. **Proof.** Now, using hypotheses  $(A_6)$  and  $(A_7)$  it can be shown that the problem  $(1.1)$  is equivalent to the (*f*)  $\psi$  (*f*)  $\psi$  (*o*)  $\psi$  (*i*)  $\psi$  (*o*)  $\psi$  (*i*)  $\psi$  (*i*)  $\psi$  (*i*) admits a solution and solution is uniformly globally attractive.<br>
Now, using hypotheses (*A*<sub>6</sub>) and (*A*<sub>7</sub>) it can be shown that the pro

Then problem (1.1) admits a solution and solution is uniformly globally attractive.  
\n**Proof.** Now, using hypotheses 
$$
(A_6)
$$
 and  $(A_7)$  it can be shown that the problem (1.1) is equivalent to  
\nfunctional integral equation  
\n
$$
u(t) = \begin{cases}\n\int [f(t, u(t))] \bigg( \phi(0) \overline{a}(t) + \overline{a}(t) \int_0^t [g(s, u(s), u_s) + h(s, u(s), u_s) + k(s, u(s), u_s)] ds \bigg), & \text{if } t \in R_+ \\
\phi(t), & \text{if } t \in I_0\n\end{cases}
$$
\n(3.2)

Set  $U = BC(I_0 \cup R_+, R)$  and define a closed ball  $\overline{B}_r(0)$  in U centered at origin of radius r given by  $r = \max\{1, L + F_0\} \max \{\|\phi\|, |\phi(0)| \|\overline{a}\| + W\}$ 

Define the operators A, B on X, 
$$
\overline{B}_r(0)
$$
 respectively by  
\n
$$
Au(t) = \begin{cases} f(t, u(t)), & \text{if } t \in R_+ \\ 1, & \text{if } t \in I_0 \end{cases}
$$
\n(3.3)  
\nAnd  $Bu(t) = \begin{cases} \phi(0)\overline{p}(t) + \overline{p}\int_0^t [g(s, u(s), u_s) + h(s, u(s), u_s) + k(s, u(s), u_s)] ds, & \text{if } t \in R_+ \\ \phi(t), & \text{if } t \in I_0. \end{cases}$ 

$$
Au(t) = \begin{cases} 1, & \text{if } t \in \mathbb{R}^n, \\ 1, & \text{if } t \in \mathbb{R}^n, \\ \phi(t), & \text{if } t \in \mathbb{R}^n. \end{cases}
$$
  
Then the equation (3.2) is transforms

Then the equation(3.2) is transformed into the operator equation as<br>  $Au(t)Bu(t) = u(t), t \in I_0 \cup R_+$ .

$$
Au(t)Bu(t) = u(t), \ t \in I_0 \cup R_+.
$$
\n
$$
(3.4)
$$

We have to Show that A and B satisfy all the conditions of Theorem 2.1 on  $BC(I_0 \cup R_+, R)$  First we show that the operators A and B define the mappings  $A: U \rightarrow U$  and  $B: \overline{B}_r(0) \rightarrow U$ . be arbitrary. Obviously, Au is a continuous function on  $I_0 \cup R_+$ . We show that Au is bounded on  $I_0 \cup R_+$ . Thus, if  $t \in R_+$ , then we obtain:  $| I_1 |$   $\in$ <br>  $| I_0$  (ous function on  $I_0 \cup R_+$ . We show that Au is bounded on  $I_0$ <br>  $| A u(t) | = | f(t, u(t)) | \le | f(t, u(t)) - f(t, 0) | + | f(t, 0) |$ 

$$
||f(t, u(t)) - f(t, 0)|| + |f(t, 0)|
$$
  
\n
$$
\leq \ell(t) \frac{|u(t)|}{K + |u(t)|} + F_0 \leq L + F_0
$$

Similarly, 
$$
|Au(t)| \le 1
$$
 for all  $t \in I_0$ . Therefore, as supremum,  
\n $|Au|| \le \max\{1, L+F_0\} = N ||Au|| \le \max\{1, L+F_0\} = N$ 

Thus Au is continuous and bounded on  $I_0 \cup R_+$ . As a result  $Au \in U$ . It can be shown that  $Bu \in U$  and in particular,  $A: U \rightarrow U$  and  $B: \overline{B}_r(0) \rightarrow U$ . We show that A is a Lipschitz on U. Let  $u, v \in U$  be arbitrary.<br>Then, by hypothesis  $(A_3)$ ,<br> $||Au - Av|| = \sup_{t \in I_0 \cup I_1} |Au(t) - Av(t)|$ Then, by hypothesis  $(A_3)$ ,

$$
||Au - Av|| = \sup_{t \in I_0 \cup I_+} |Au(t) - Av(t)|
$$
  
\n
$$
\leq \max \left\{ \sup_{t \in I_0} |Au(t) - Av(t)|, \sup_{t \in I_+} |Au(t) - Av(t)| \right\}
$$
  
\n
$$
\leq \max \left\{ 0, \sup_{t \in I_+} \ell(t) \frac{|u(t) - v(t)|}{K + |u(t) - v(t)|} \right\}
$$
  
\n
$$
\leq \frac{L ||u - v||}{K + ||u - v||}
$$

for all  $u, v \in U$ . This shows that A is a D-Lipschitz on U with D-function  $\psi(r) = \frac{Lr}{\sigma}$  $K + r$  $=$  $\frac{m}{r}$  next, it can be shown that B is a compact and continuous operator on U and in particular on  $\overline{B}_r(0)$  Next, we estimate the value of the constant M.By definition of M, as<br> $|B(\overline{B}_r(0))|| = \sup \{ ||Bu|| : u \in \overline{B}_r(0) \}$ shown that B is a compact and continuous operator<br>value of the constant M.By definition of M, as<br> $|B(\overline{B}_r(0))| = \sup \{ ||Bu|| : u \in \overline{B}_r(0) \}$ 

show that all B is a complete that continuous operator of D can be the constant M.By definition of M, as  
\n
$$
|B(\overline{B}_r(0))| = \sup \{ ||Bu|| : u \in \overline{B}_r(0) \}
$$
\n
$$
= \sup \{ \sup_{t \in I_0 \cup I_+} |Bu(t)| : u \in \overline{B}_r(0) \}
$$
\n
$$
\leq \sup \{ \max \{ \sup_{t \in I_0} |Bu(t)|, \sup_{t \in I_+} |Bu(t)| \} \} : u \in \overline{B}_r(0) \}
$$
\n
$$
\leq \sup_{u \in \overline{B}_r(0)} \{ \max \{ ||\phi||, |\phi(0)||\overline{u}(t)| + \sup_{t \in I_+} |\overline{p}(t)| \} \int_0^t |g(s, u(s), u_s) + h(s, u(s), u_s) + k(s, u(s), u_s) | ds \} \}
$$
\n
$$
\leq \max \{ ||\phi||, |\phi(0))|| \overline{p} || + W \}
$$

, *Thus*

 $|| Bu || \le \max \left\{ || \phi ||, | \phi(0) | || \overline{p} | + W \right\} = M$ for all  $u \in \overline{B}_r(0)$ . Next, let  $u, v \in U$  be arbitrary. Then,

$$
\begin{aligned}\n& Existence \text{ Theory For Quadr} \\
|u(t)| &\leq |Au(t)| \text{ } |Bv(t)| \\
&\leq ||Au|| ||Bv|| \\
&\leq ||A(U)|| ||B(\overline{B}_r(0))|| \\
&\leq \max \{1, L + F_0\} M \\
&\leq \max \{1, L + F_0\} \max \{||\phi||, |\phi(0)| ||\overline{p}|| + W\} \\
&= r\n\end{aligned}
$$

For all  $t \in I_0 \cup R_+$  . Therefore, we have:

For all 
$$
t \in I_0 \cup R_+
$$
. Therefore, we have:  
\n $||u|| \le \max\{1, L + F_0\} \max\{| |\phi||, |\phi(0)| || \overline{p}|| + W \} = r$ 

This shows that 
$$
u \in \overline{B}_r(0)
$$
 and hypothesis (iii) of Theorem 2.1 is satisfied. Again,  
\n
$$
M\phi(r) \le \frac{L \max\left\{ \|\phi\| \|\phi(0)\| \|\overline{p}\| + W \right\} r}{K + r} < r
$$

For r>0, because L max  $\{ || \phi || | \phi(0) || || \overline{p} || + W \} \le K.$ 

Therefore, hypothesis (iv) of Theorem 2.1 is satisfied. Now we apply Theorem 2.1 to the operator equation Au Bu = u to yield that the problem (1.1) has a solution on  $I_0 \cup R_+$  Moreover, the solutions of the problem(1.1) are in  $\overline{B}_r(0)$  Hence, solutions are global in nature.  $u = u$  to yield that the problem (1.1) has a solution on  $I_0 \cup R_+$  Moreover, the solutions of the<br>  $m(1.1)$  are in  $\overline{B}_r(0)$  Hence, solutions are global in nature.<br>  $v,$  let  $u, v \in \overline{B}_r(0)$  be any two solutions of th

Finally, let  $u, v \in \overline{B}_r(0)$  be any two solutions of the problem(1.1) on  $I_0 \cup R_+$  . Then

$$
A \cdot B \cdot U = u
$$
 to yield that the problem (1.1) has a solution on  $I_0 \cup R_+$  Moreover, the solutions of the  
problem(1.1) are in  $\overline{B}_r(0)$  Hence, solutions are global in nature.  
Finally, let  $u, v \in \overline{B}_r(0)$  be any two solutions of the problem(1.1) on  $I_0 \cup R_+$ . Then  

$$
|u(t)-v(t)| \leq |\int f(t, u(t))| \left(\phi(0)\overline{p}(t) + \overline{p}(t)\int_0^t [g(s, u(s), u_s) + h(s, u(s), u_s)] + k(s, u(s), u_s) ds\right) - [\int f(t, v(t))] \left(\phi(0)\overline{p}(t) + \overline{p}(t)\int_0^t [g(s, v(s), v_s) + h(s, v(s), v_s)] + k(s, u(s), v_s) ds\right)
$$
  

$$
\leq |f(t, u(t)) - f(t, v(t))| \left(\phi(0)\overline{p}(t) + \overline{p}(t)\int_0^t [g(s, u(s), u_s) + h(s, u(s), u_s)] + k(s, u(s), u_s) ds\right)
$$
  

$$
+ |f(t, v(t))| \left(\overline{p}(t)\int_0^t \left[\left[g(s, u(s), u_s) - g(s, u(s), u_s)\right] - [k(s, u(s), u_s) - k(s, v(s), v_s)\right] ds\right]
$$
  

$$
\leq |f(t, u(t)) - f(t, v(t))| \left(|\phi(0)||\overline{p}(t)| + |\overline{p}(t)||_0^t h(s) ds\right)
$$
  
+2[|f(t, u(t)) - f(t, 0)| + |f(t, 0)||r(t)|  

$$
\leq \Gamma(t) \frac{|u(t) - v(t)|}{K + |u(t) - v(t)|} (|\phi(0)||\overline{p}|| + R)
$$
 (3.5)  
+2
$$
\frac{\Gamma(t) |v(t)|}{K + |v(t)|} + F_0 \frac{r(t) |v(t)|}{K + |v(t)|} + F_0
$$

$$
+2\left[\frac{C(t)|v(t)|}{K+|v(t)|} + F_0\right]r(t)
$$
  
\n
$$
\leq \frac{L(\left|\phi(0)\right| \left|\left|\frac{p}{p}\right|\right| + R) |u(t) - v(t)|}{K+|u(t) - vy(t)|} + 2(L+F_0)r(t)
$$
  
\nsuperior as  $t \to \infty$  in the above, we get

Taking the limit s  $\lim_{t\to\infty} |u(t) - v(t)| = 0$ 

$$
\lim_{t\to\infty} |u(t)-v(t)|
$$

Hence, there is a real number  $T > 0$  such that  $|u(t) - v(t)| < \epsilon$  for all  $t \geq T$ . Obviously, the solutions of problem(1.1) are uniformly globally attractive on  $I_0 \cup R_+$ .
