

Research Paper

Present status of environment and provide an idea for minimizing this problem

Interested Area/Track: Environment

Level of Difficulty: Intermedium

Learning Objective(s): Discuss well up issues with an optimize accomplishment to practice recuperation idea and derived various types of synthetic practices & polluted culture. And forward a message for future condition and situation upon with imagine problems. This article's views are based on -

1. How we recuperation our present environment status
2. Being a human, how we neglect our single one point involvement from this non-sustaining faith
3. And provide a compendium & understanding on environment, pollution and pollution free earth

Materials & methods:

- Internet Browsing
- Get suggestion and valuable information from Dr. Tanuka Roy Sinha
- Gather a lot of knowledge through daily news paper, magazine

Abstract: In this article the writer described why cure environment is needed for the purpose of the development. How we unconsciously use a rubber to erase the 'development' & how our earth become polluted through various component, like – chemical product effect, global warming effect, destroy the rain forest etc. Even maximum populations are making pollution within their own habit or benefit greed, but it's not right. In this technological era we have variety types of option for the purpose of alternative way and stand for sustainability. And if we are not actually concern for this agitation then our future generation will blame us seriously and they face enormously dangerous situation where reconstruction chance like a dry leaf. Hence, create a logical view for anxiety for the purpose.

Keywords: Environment, protection soil quality, water resource and purified air, encouraging various eco-systems or raising the future problem through the present scenario.

I. Introduction:

In the 21century, we are very comfortable in various zones on various fields. In this period we face various types of problems, these problems are social and environmental problems. In these sense we can remind the thought of Amarta Sen's 'Development as freedom'. Where our background focus mainly form origin to end which indicates a stable future planning with a various opportunities. On this platform our plan is to bring everyone under an umbrella where everyone can sustain the plenty of materials and face each environmental problem equally.

Body: On this basis we, people have to control ourselves from our excessive greed, sinister culture, excessive wastage of materials and foods instead of using these as resources. If these wastage materials and our desires to greed are controlled then we can make an ethical nonviolence society and environment. And the duration of societal development can be a long term process. This article is based on sarvadaya system (Uplift all) which holds our planning of achieving a sustainable platform where we have decided to be enhancing our future budget of resources. As a result we can make and balance our ecosystem. For our excessive use and waste of natural resources, the levels of these resources are decreasing just like coal, diesel, petrol and LPG etc. We are thinking of managing and minimizing difficult types of environmental issues and pollution related problems. To avoid these problems we have thought a using green energy like, solar energy, water & wind energy.

Because this idea non polluted and purely sustainable. If these are properly used then we can make a sustainable society, otherwise we have to face dangerous problems in future.

Today environmental problems is a big issues and its time face with this pollution, we all know about global warming which is the most important environmental problems. The reason of increasing global warming is our non maintaining sustainable planning, excess used of material and using of chemical both in water & soil in industries, people use chemical and different kinds of materials which wastage materials are thrown to rivers and ocean. These things assimilated and polluted the water and destroy the bio system. In agriculture farm DDT and other chemical are used to destroy the germs our organic product and farming then a sustainable environment can be build. Similarly here we have another way to reduce the water pollution. In this case we have to increase the recycling process of using the wastage chemical, oil. These soil pollution and water pollution can be solved through this recycling waste management.

An example of this environmental issue is the melting of Atlantic ice and breaking the coral wall. The various behind is these issues are known to all. Despite that we are not conscious about this. And we think it casually. As a result our future generation will face a great problems which will be difficult to recover for this our govt should impose a panoptical surveillance upon us because only the rules and regulation can help people bring in a limited boundary.

If you use nature bio product with a proper scientific process just like instead of using plastic we should used paper bags, cotton bag and other objects which are produced with mud, ceramic and jute products, etc. People should used battery motor bike instead of using petrol in bike and other vehicles. We have to increase the use of solar electricity, huge petroleum, wind mills, etc. So, we can set an endangered sustainable environment. All this process and products are non polluted and have a very low cost. These can reduced the matter of flooding, famine and minimize the use of limited natural resources (Coal, Petrol, LPG, and Diesel) and huge plantation also filter our air system. This green energy revolution is necessary anyhow. And now days we are very lucky as we may option recover and make our environment sustainable but in future these options will be reduced automatically and gradually. We have to be broad and open minded for continuing our responsibility to our future generation. We need to store water while raining. As a result we can make our environment a non polluted and increase a habit of good livelihood.

A secure idea is necessary to solve out the issues related to the environment become positive thinking can eradicated our ongoing blind practices. If we don't observe our present prescription then one day our next generation will blames us. So, it's our duty to protect her and select the veritable ways to lead towards secure sphere. Today 'Naturalism' idea is essential because our ecosystem, eco-diversity is refer to the concept of nature and is also to environment. Hence we should protect and environment because this environment our nature feeds us. In Rabindranath Tagore' poem "On the Nature of Love" nature is compare with sweetheart lady. Just like sweet girl, fulfilling our all needs. Despite that human destroy the system of nature (Cutting tress, polluted water & Soil and air, artificial weather change). As a result one day will come when we have to buy oxygen cylinder from a hospital or legal stall. Even we have to buy water at 200 Rs. & soils are passive. Hence, we have understood what we shall do to make our nature healthy.

II. Conclusion:

As a social worker views, we should increase awareness, sharing information and what would be consequences. We have to work as a group or community in micro to macro as if it's our duty to all. We have to take participation with particular minded and should be aggressive and active on solving these people knowledge. In this case social workers should be used and what should be prohibited. Even on govt should spear these issues though media, intent, television etc. To interpret the whole matter, a social worker ca analyses and convey deeply the loopholes and give people the way how to solve and minimizing the problems and perfect planning. And when we easily build a better communication system and try to build a 'we feeling concept' that time we can surely develop our ecosystem & environment in proper way. So, hence is as message of awareness and decision making power though which a better environment and society can be built.

Upon of this total image, we want a clean green environment where we live in sustainable and polluted less society.

Present status of environment and provide an idea for minimizing this problem

I have completed my paper and I'm happy to submit this. I wish everything is well, but this presentation is very short. I did not have either much time or any creative approach and I will come next time if the opportunities are available for me. I would like to thank to the whole team and our respected madam Dr. Tanuka Roy Sinha of this presentation program.
